TEAM DETAILS

ChainSight

Crypto Fraud Investigation Intelligence

From a reported wallet to traceable fund flows, likely exchange links and source-backed intelligence.

PROBLEM STATEMENT

Real-Time Identification of Fraud-Linked Cryptocurrency Exchanges from Victim-Reported Suspect Wallet Addresses through Automated Blockchain Analytics

Theme: Blockchain & Cybersecurity
Category: Software

TEAM

Ayush Sharma

Product Strategy & Crypto Domain Research

1+ year of hands-on cryptocurrency market and trading experience

Chhaya Attri

Product Research & Presentation

Research, evidence organisation and communicating the proposed workflow

Problem Statement: The Investigation Gap

From reported wallet to actionable lead

₹22,845 cr

lost by citizens to cyber fraud in 2024, against ₹7,465 crore in 2023

22.68 lakh

cybercrime incidents registered on the NCRP portal in 2024

Source: Ministry of Home Affairs, written reply in the Lok Sabha (2025), as reported by Outlook Money and The Wire. All cyber fraud, not crypto only.

The problem

Investigators receive a suspect wallet address but must manually trace fund flows and identify potentially relevant exchanges.

The consequence

Delays can complicate evidence preservation and timely requests to exchanges.

The opportunity

Combine blockchain transaction tracing with public-source intelligence to help investigators prioritise leads.

Not every reported wallet holds recoverable funds, and not every trail reaches an exchange.

Proposed Solution

Reported wallet → investigator-ready report

What's different: on-chain tracing and TinyFish open-web research combined in one source-linked report

1

Reported wallet

Input from an investigator

2

Trace fund flows

Follow observable on-chain transactions

3

Identify potential exchange links

Show the evidence and confidence level

4

Research with TinyFish

Find public scam reports and official exchange procedures

5

Investigator-ready report

Transactions, source URLs, timestamps and a verification checklist

A lead is not proof of guilt. Final verification and action remain with the investigator.

Target Users

PRIMARY

State cybercrime police units and cyber cells

Officers who receive suspect wallets from victim complaints

OPERATIONAL PARTNER

Authorised LE liaison teams at exchanges / VASPs

Receive clearer, source-backed requests from investigators

POTENTIAL FUTURE

Bank fraud investigation teams

Follow crypto cash-outs into the banking system

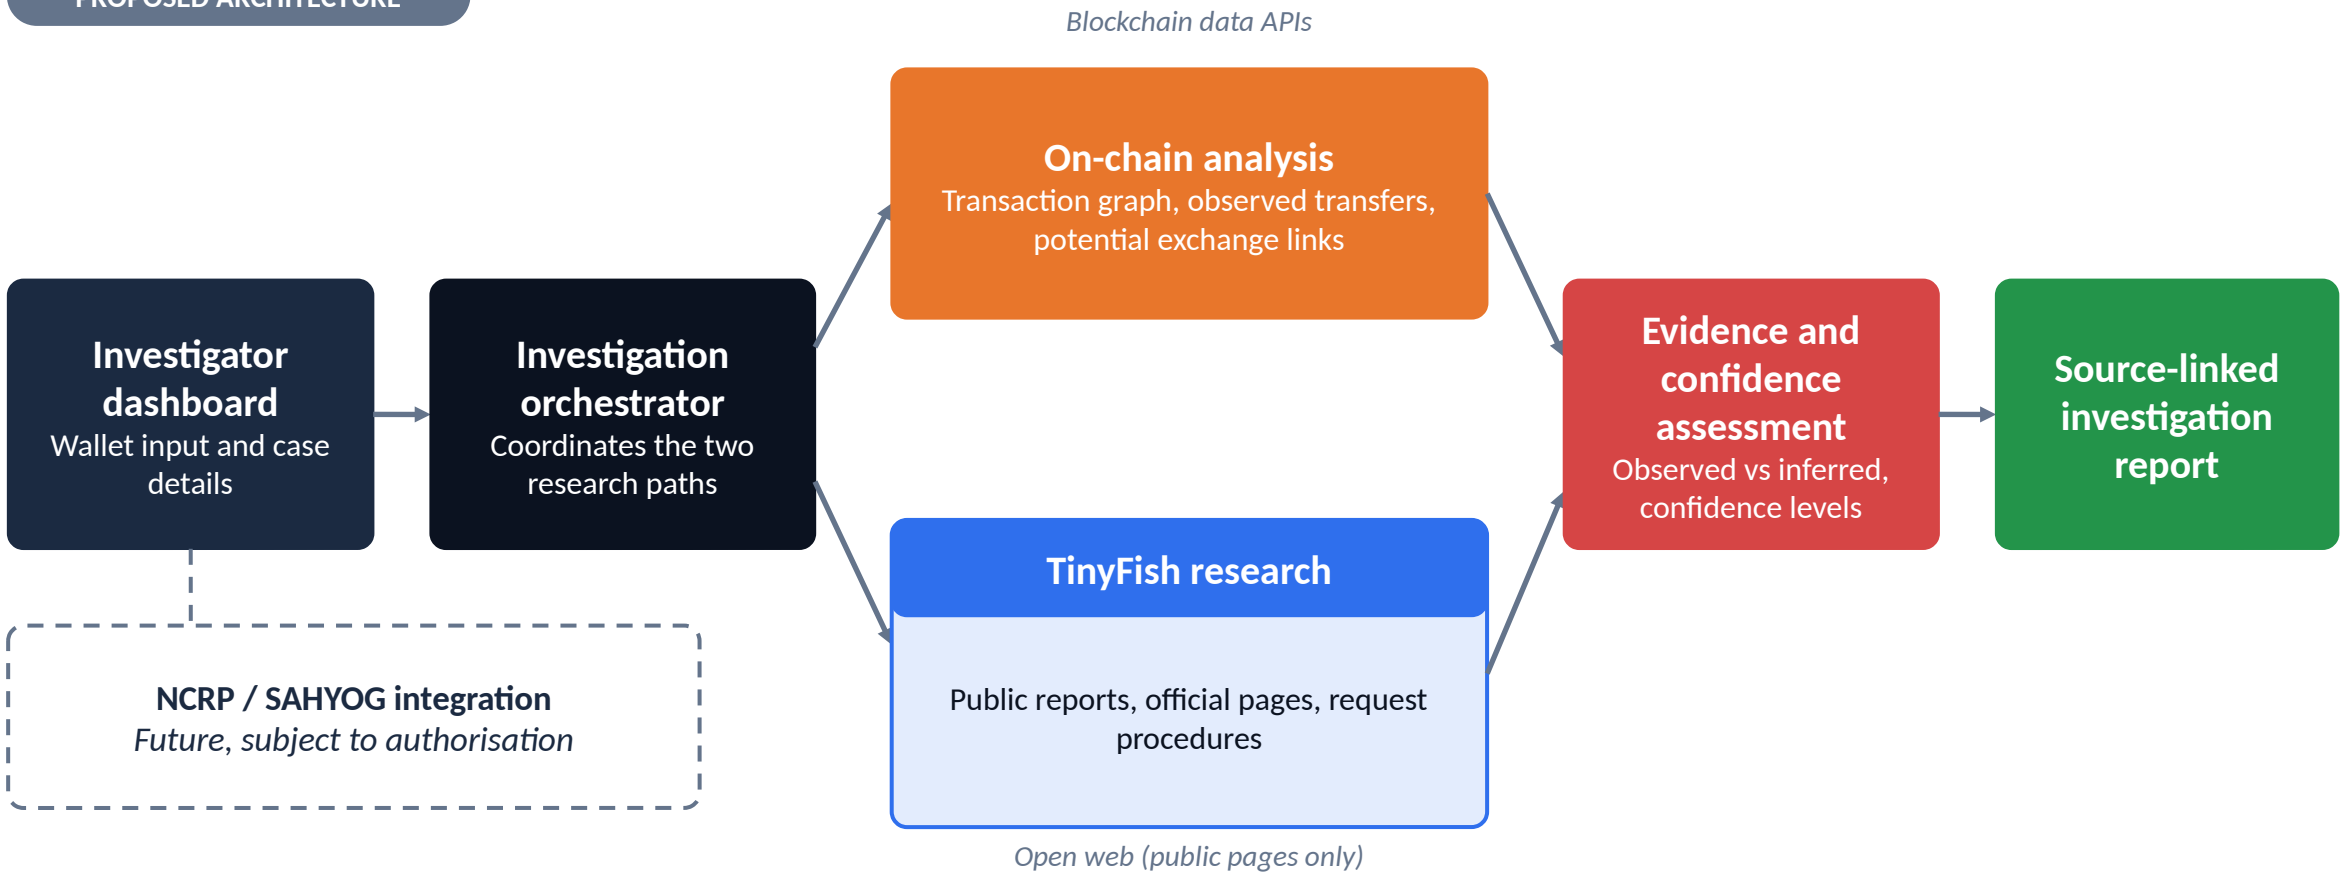

VALUE TO INVESTIGATORS

- **Faster fund-flow review**
- **Prioritised leads with explainable confidence**
- **Easier discovery of official exchange request procedures**
- **Traceable sources and organised evidence**

Goal: faster, better-supported requests to exchanges, which may improve the chance of timely intervention. Impact to be measured, not assumed.

Technical Architecture and Stack

PROPOSED ARCHITECTURE

STACK

Python / FastAPI | Blockchain data APIs | NetworkX | PostgreSQL | React | TinyFish API

How You Plan to Integrate the TinyFish API

TinyFish supports open-web research; blockchain transaction tracing is performed separately using blockchain data sources.

1. Search

Discover public scam reports and official exchange websites

2. Fetch

Retrieve pages, extract relevant information, record URLs and retrieval times

3. Web Agent

Navigate publicly accessible exchange pages to find official law-enforcement procedures and required documents

SAMPLE OUTPUT (ILLUSTRATIVE)

Field	Example
Source type	Official exchange website
Information found	Law-enforcement request procedure
Evidence	Source URL and retrieval timestamp
Review status	Pending investigator verification

Why an agent, not a scraper? Exchange sites differ, change often and have no API. One goal works across them.

Limits: TinyFish does not verify wallet ownership or identify account holders. It gathers public information for investigators to verify.

Scalability, Feasibility and Use Case

PROPOSED INITIAL SCOPE

- One reported wallet per investigation
- One network initially, e.g. Tron
- Tracing through available data sources
- TinyFish research on public reports and 1–2 exchange sites
- A sample report with explicit confidence levels and source references

Roadmap

NEXT PHASE

Additional networks, deeper tracing, improved risk rules

LONG-TERM

Authorised government integrations, advanced analytics, broader exchange coverage

Scales by configuration

A new network or exchange is a configuration entry, not a new scraper. Tracing and research run in parallel.

Risks and mitigations

Uncertain attribution

Confidence levels plus investigator verification

Incomplete transaction trails

Mark where the trail breaks (mixers, bridges) as unresolved

Inaccessible websites

Retries, then flag for manual research

False positives

Explainable reasons and human review

Use Case: Real-World Precedent

Coordinated crypto fund tracing. It shows the problem is real; it is not a ChainSight result.

Sources: Blockworks, "Tether says it froze $225M in USDT following DOJ collaboration" (blockworks.co/news/tether-freezes-funds-doj); OCCRP, "Crypto Firms Help Take Down International 'Pig Butchering' Scam" (occrp.org); Benzinga (Nov 2023).

ILLUSTRATIVE APPLICATION OF OUR PROPOSED WORKFLOW

1. **An officer enters a reported wallet**
2. **The system traces observable transactions**
3. **Potential exchange links and public intelligence are assembled**
4. **The officer verifies the lead and follows the exchange's official process**

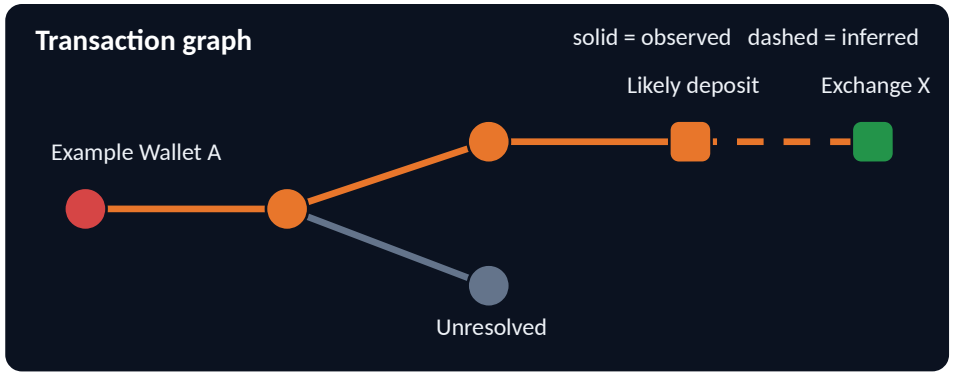

MVP / Prototype: Proposed Investigator Report

CONCEPTUAL UI DESIGN | ILLUSTRATIVE DATA

ChainSight | Case ID: DEMO-001 | Network: Tron | Illustrative data

Report export: proposed feature

Transaction graph

Potential exchange link

Exchange X Confidence: Medium

- Funds swept into a wallet with a public Exchange X label
- Deposit-address pattern observed
- Not proof that Exchange X still holds the funds

Sources (illustrative)

example-scam-reports.org/report/...
retrieved 10:42 UTC
exchange-x.example/law-enforcement
retrieved 10:44 UTC

Transactions (illustrative hashes)

OBSERVED	Wallet A → Wallet B	0xA1...(illustrative)
OBSERVED	Wallet B → Wallet C	0xB2...(illustrative)
INFERRED	Wallet D → Exchange X	n/a

Unresolved questions

- Where did the branch to the unresolved wallet go?
- Is the Exchange X label current?
- Do funds remain at the address?

Investigator verification checklist

- [ ] Verify transaction hashes on an explorer
- [ ] Confirm sources and timestamps
- [ ] Follow the exchange's official process

Conceptual prototype using illustrative data. No live investigation or exchange attribution has been performed by ChainSight.
