TEAM DETAILS

# ChainSight

Wallet in. Exchange, contact and evidence out.

**Team [Team name] | [Institution] | [Contact email / phone]**

### [Member 1]

Lead, product and pitch

[College / year]

### [Member 2]

On-chain tracing

[College / year]

### [Member 3]

TinyFish agents, backend

[College / year]

### [Member 4]

UI/UX and report

[College / year]

# Problem Statement

## Funds move within hours. Finding the right exchange takes days.

**₹22,845 cr**

lost by Indians to cyber fraud in 2024, about 3× the ₹7,465 crore lost in 2023

**22.68 lakh cybercrime complaints on NCRP in 2024**

*Source: Ministry of Home Affairs, written reply in the Lok Sabha (2025)*

### Who is hurt

Victims of investment, task, sextortion, phishing and ransomware scams paid in crypto

### How the money hides

Burner wallets and fast hops (layering) hide the trail across chains

### Why investigators get stuck

Only the exchange can freeze funds and reveal identity. Tracing to it needs rare skills, then manual research for its contact

### Why it fails today

Commercial tools are costly and don't automate the web research. By the time the request is sent, funds have moved

# Proposed Solution

## Wallet in → exchange, contact and evidence out

### Report a wallet

Wallet address + chain, from dashboard or API

### Trace the money

Follow funds hop by hop; spot laundering patterns

### Find the exchange

Match the exchange deposit address funds landed in

### Research the web

Public scam reports, exchange's law-enforcement contact

TinyFish

### Hand it over

Fund-flow graph, risk lead, contact, hashed evidence, draft freeze request

TinyFish

**A human investigator always decides.** The risk score is a lead, not proof of guilt.

# Target Users

PRIMARY

## State cyber cells and police units

Teams handling NCRP complaints and SAHYOG requests

SECONDARY

## Exchange and VASP compliance teams

Spot reported fraud flows landing on their platform

SECONDARY

## Banks' fraud units

Link crypto cash-outs to the accounts they hold

VALUE TO THEM

### Faster freezing

exchange and contact in one run

### Less reliance on rare experts

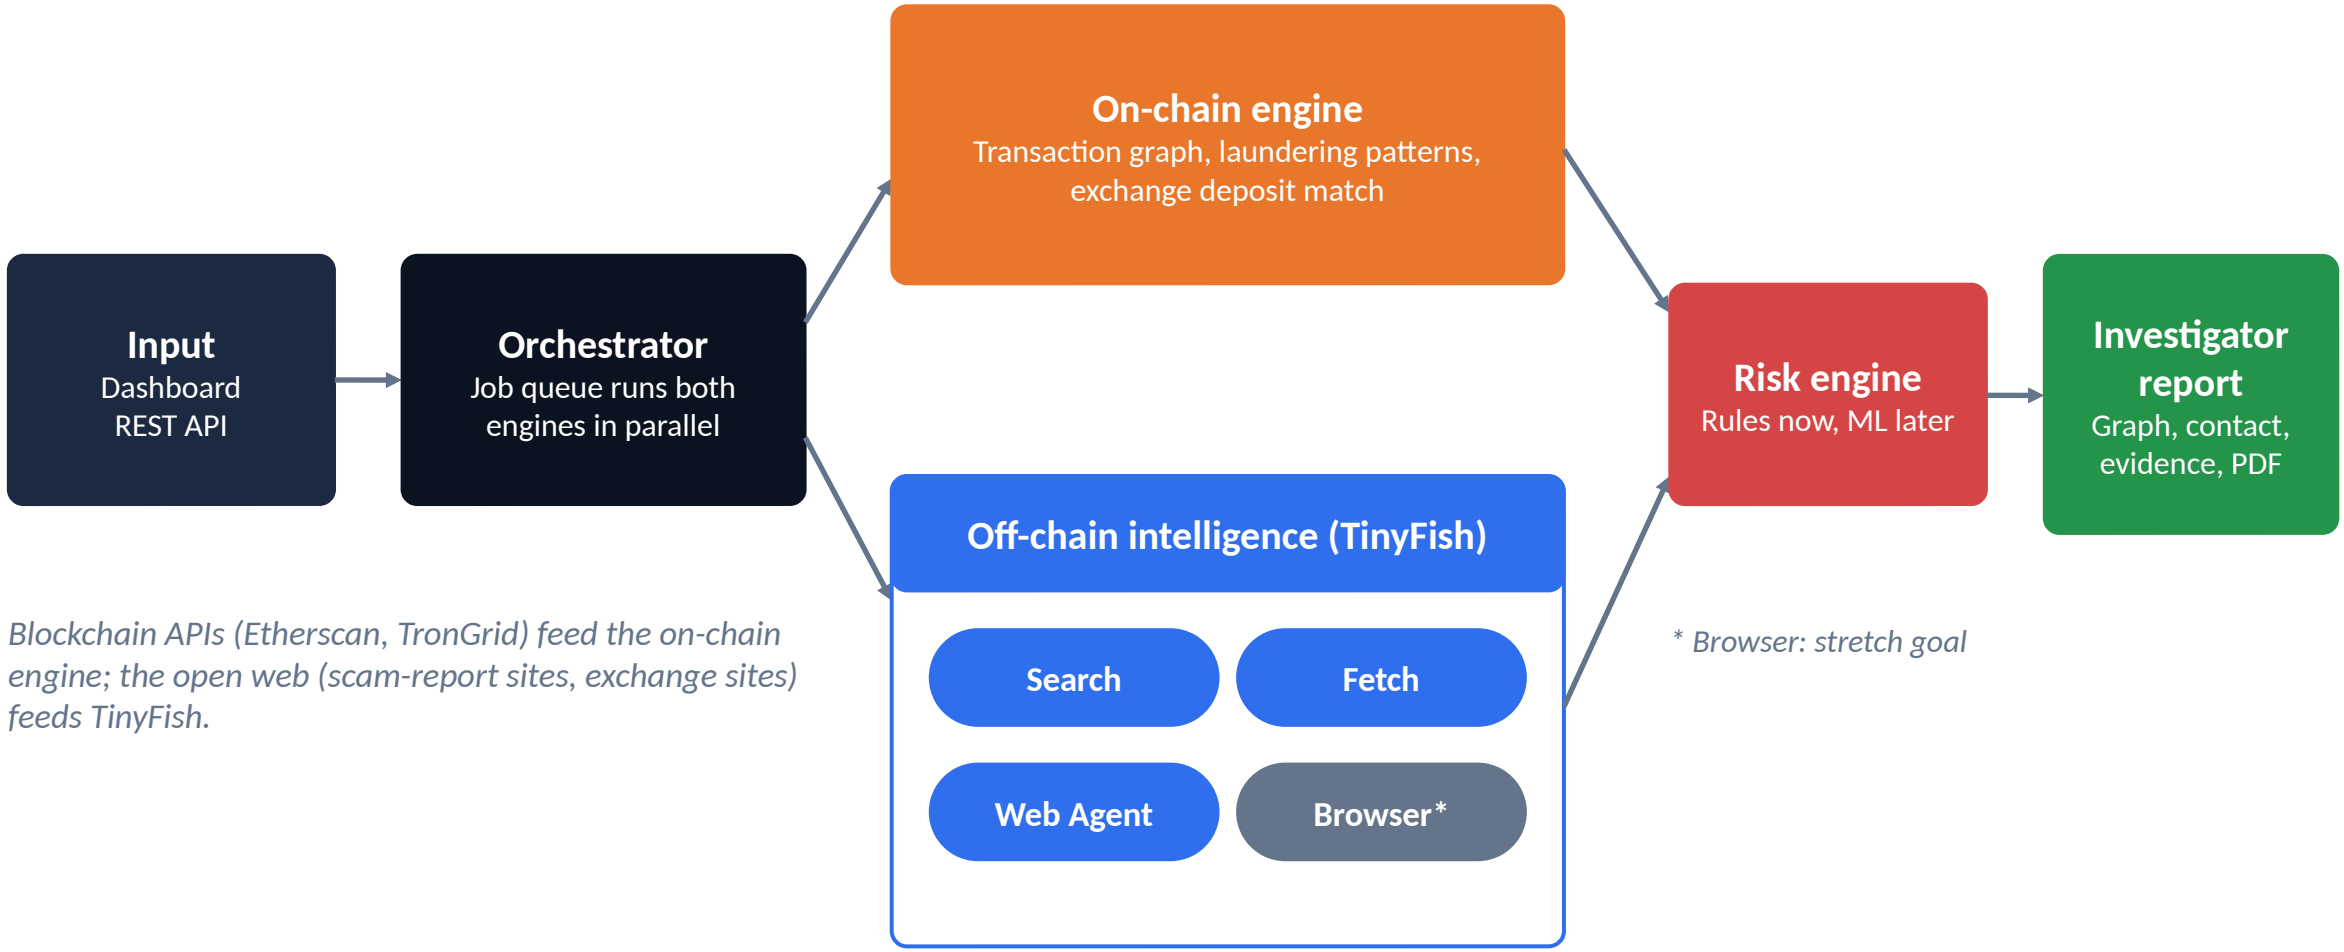

any trained officer can act

### Standardised evidence

same report, hashed snapshots

# Technical Architecture and Stack

*Blockchain APIs (Etherscan, TronGrid) feed the on-chain engine; the open web (scam-report sites, exchange sites) feeds TinyFish.*

* *Browser: stretch goal*

**STACK**

Python + FastAPI | Redis worker | PostgreSQL | NetworkX graph | React + graph view | PDF reports | TinyFish API

# How You Plan to Integrate the TinyFish API

## TinyFish does every step that needs the open web, where no API exists

| | IN OUR FLOW | WHY TINYFISH |
|---|---|---|
| **Search** | Finds the wallet on scam-report sites, forums and social pages | Structured live results, not a list of links to scrape |
| **Fetch** | Reads each page; confirms the address is really there; reads exchange policy pages | Clean text from any page, JS-rendered or not |
| **Web Agent** | Navigates the exchange's site to its law-enforcement request process and contact | Multi-step, different on every site; returns structured JSON |

### Why not a normal scraper?

Every exchange site is different, changes often and has no API. One agent goal works across all of them; a scraper needs a script per site.

### Example agent goal

*"Find this exchange's law-enforcement request process. Don't log in. Return portal, steps, documents, contact." Returns JSON fields we drop into the report.*

# Scalability, Feasibility and Use Case

## BUILDABLE IN 24 HOURS

- Two chains: Tron + Ethereum
- One flow: single reported wallet
- Trace to a known exchange
- TinyFish: wallet mentions + exchange contact
- One-page investigator report

*Roadmap: more chains, cross-chain bridges, ML scoring, NCRP/SAHYOG integration*

## Scales by configuration

New exchange or chain = one config entry, no new scraper

Tracing and agents run in parallel via the job queue

Exchange contacts cached and reused across cases

**Feasible now: existing blockchain APIs + TinyFish, no custom indexer**

## Risks we plan for

**Agent fails on an odd site**

Retries, then manual-review flag

**Exchange labels incomplete**

Infer deposit addresses from sweep behaviour

**False positives**

Human review; score explained point by point

**Legal limits**

Authorised use, audit log, agents never log in

# Use Case: Worked Example

## A real public case shows the payoff: once the right company is found and asked, scam funds get frozen

*Sources: Blockworks, OCCRP, Benzinga coverage of the Tether / OKX announcement (Nov 2023)*

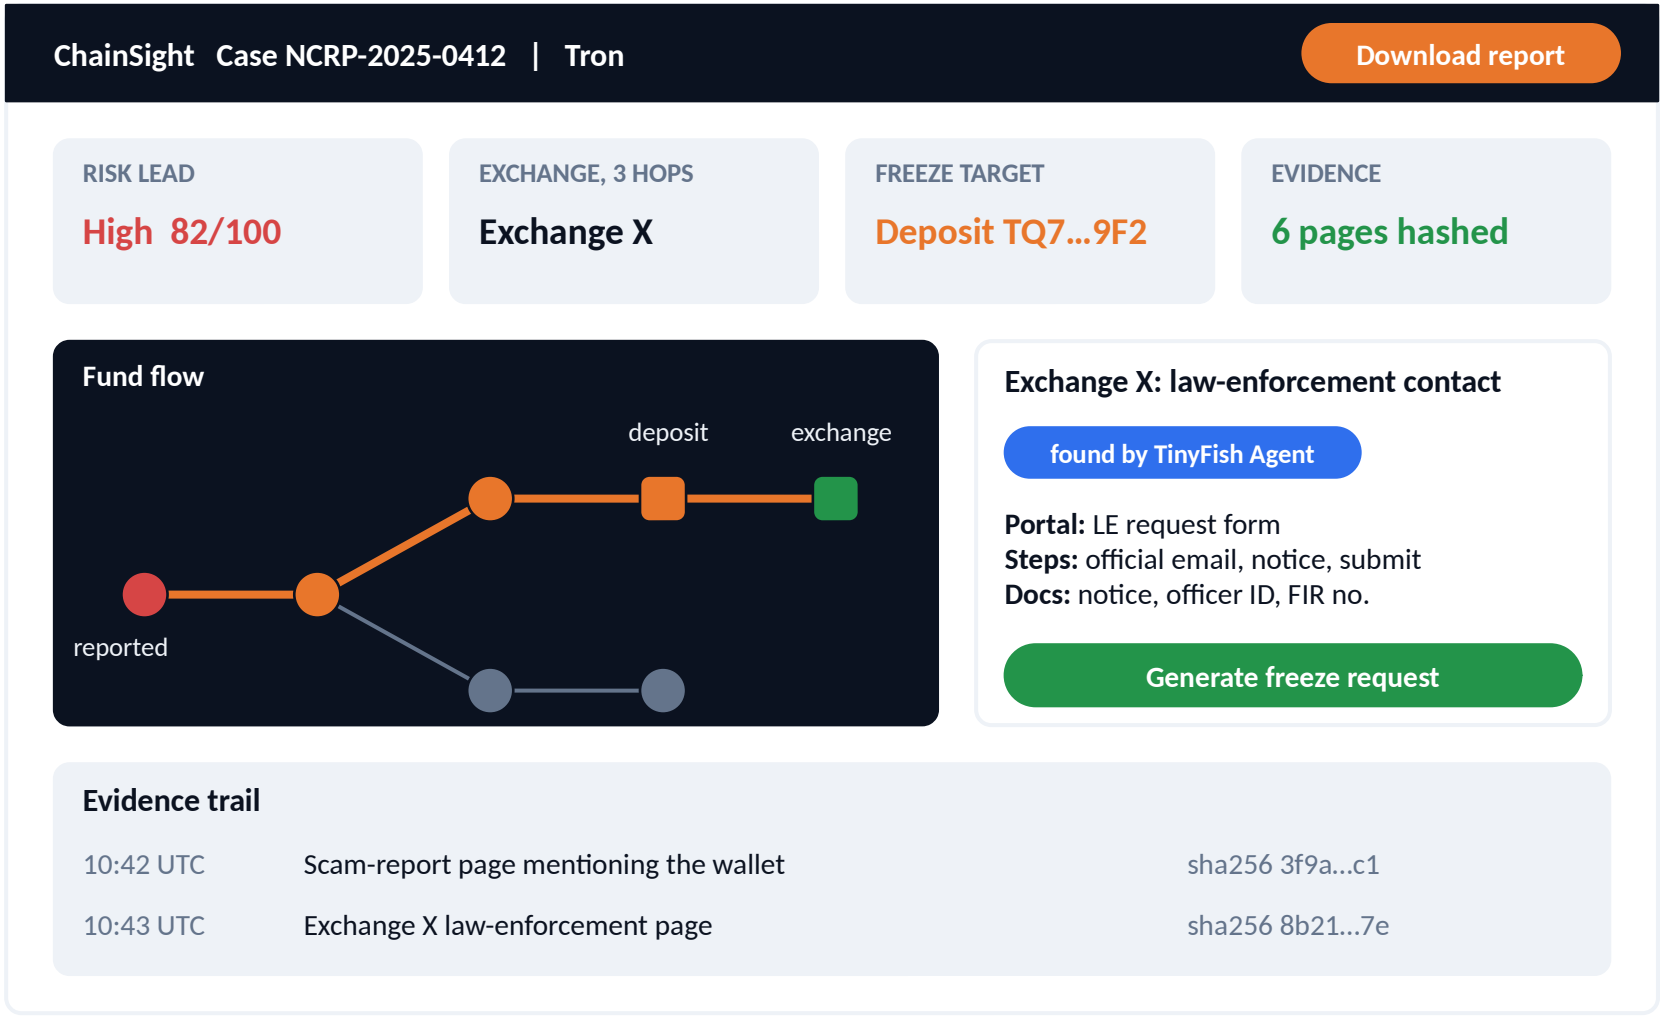

## What ChainSight automates for an Indian cyber cell, in the same flow

- Officer enters the reported wallet from the NCRP complaint
- Funds traced to an exchange deposit address
- TinyFish finds public reports and the exchange's request process
- Officer reviews and sends the pre-filled freeze request

*Goal: an investigator-ready request in minutes instead of days of manual tracing and research (to be measured in the build).*

# MVP / Prototype

*Figma-style mockup of the investigator report (illustrative data)*

1. **Risk lead with reasons**

   Explained score, never a verdict

2. **Path to the money**

   Hops from the reported wallet to the exchange

3. **Who to contact**

   Found by the TinyFish agent

4. **Proof for the case**

   Timestamped, hashed page snapshots
